Newly published research from the University of Rochester Medical Center shows that the PSA test has life-saving benefits to men of all ages. Without routine PSA testing, the number of men diagnosed with an incurable form of advanced prostate cancer, also referred to as metastatic prostate cancer, would triple.

Many prostate cancer experts believe widespread availability and usage of the PSA test contributed to a prostate cancer death rate reduction by nearly half. Dr. David Samadi, a leading robotic prostatectomy surgeon from The Mount Sinai Medical Center in New York City, points out the precision with which this data supports that claim.

"Today, roughly 8,000 men are diagnosed with advanced prostate cancer. To triple that number would, in fact, double the number of men who succumb to the disease each year," he explains.

ZERO has partnered with Dr. Samadi, Vice Chairman, Department of Urology and Chief of Robotics and Minimally Invasive Surgery at The Mount Sinai Medical Center in New York City, to help educate and answer questions from our readers. Look for more content from him in future issues of ZEROHour!

Prostate Cancer Among African American Men Reaches Epidemic Proportions

The U.S. Senate recently passed a resolution acknowledging that awareness and prevention of prostate cancer is as critical as it's ever been for African American men. The resolution, which was introduced by Sen. John Kerry (D-Mass.), urges federal agencies to address what they're now calling an "epidemic" by supporting education, awareness outreach and research specifically focused on how prostate cancer affects black men.

African American men have the highest rate of prostate cancer in the world, with one in five men getting the disease during his lifetime. Want to know more about your risk? Read ZERO's fact sheet [Ten Things African American Men Should Know About Prostate Cancer](#).
